                                                                                                                                                                                                                            AAN50205 is the gene sequence of the natural LTA gene. The LTA gene the site directed mutant SDM1 (see AAN50206) is inactive. The inventors claim a vaccine prepr. active against pig scours which contains an inactivated LTA component, together with additional K88 antigens opt. with whole cells comprising the antigens or contg. the inactivated LTA.

An LTh-STla-STlb probe, wherein all all or part of the sequences of the three toxin genes represented in AAQ23864-66 are ligated to each other by T4DNA ligase, may be used for the detection of Vibrio cholerae and enterotoxigenic E.coli Simultaneously in a simple way.

The method has the same sensitivity as the dangerous radio-isotope

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            was made to accomodate the creation of a Ncol restriction site around the initiator methionine codon. Novel polynucleotides encode a mutant LT-A polypeptide or a mutant vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the production of transgenic plants for the

PF 2000-4426 CC processing. A single codon insertion (GTG encoding valine) was made to CC accomodate the creation of a NcoI restriction site around the CC initiator methionine codon. Novel polynucleotides encode a mutant LT-A CC polypeptide or a mutant Vibrio cholera cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to CC the wild-type LT-A or CT-A polypeptide and where at least one of the CC codons is altered to a plant preferred codon. The polynucleotide further CC comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B CS subunit (CT-B). The polynucleotides are useful for the transformation of CT plant cells for the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. coli or V. cholerae. CC prophylactic or therapeutic treatment against E. coli or V. cholerae. CC The mutant polypeptides are also useful as adjuvants. CC constructed from the wild type LT-A cDNA shown in AAA51106 which is A subunit (LT-A). The nucleotide at position 631 was changed from the wild-type A to G which causes a change of arginine to glycine in the mature protein at residue 192. The sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA This cDNA encodes a mutant R192G Escherichia coli heat-labile toxin (A subunit (LT-A). The nucleotide at position 631 was changed from the Figure 1 of the specification (E)

The LTA gene the site directed mutant SDM1 (see AAN50206) is inactive. The inventors claim a vaccine prepn. active against pig scours which contains an inactivated LTA component, together with additional K88 antigens opt. with whole cells comprising the antigens or contg. th inactivated LTA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CDS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC type LT. The substitution of Ser to Tyr at position 63 in LTS63Y blocks CC NAD-binding. Deletion of Glu residues at positions 110 and 112 in CC LTdel110/112 eliminate the enzymatic activity of LT. The Al subunit of CC wild type LT catalyses ADP-ribosylation of Gs, a GTP-binding protein that CC diarrhoea in humans and animals e.g. pigs. The mucosal immunogenicities CC of mutant heat-labile endotoxins LTS63Y and LTdel110/112 were tested. CC Groups of mice were immunised with LTS63Y and LTdel110/112. The control CC groups received phosphate buffered saline (PBS) alone. The serum and CC faecal antibody titres to LT were determined. The results showed that CC comparable level of anti-LT antibodies in sera and faecal extracts CC compared with those immunised with wild-type LT. The LT mutants are CC useful as a vaccine for preventing and treating diarrhoea and as an CC adjuvant for antibody production.

                                                                                                                                                                                                                    are two novel detoxified and immunologically active proteins (IT mutants) derived by site-directed mutagenesis of the Al subunit of wild type IT. The substitution of Ser to Tyr at position 63 in LTS63Y blocks (LTdell10/112 eliminate the enzymatic activity of LT. The Al subunit of wild type LT catalyses ADP-ribosylation of Gs, a GTP-binding protein that regulates cAMP levels. The resulting increase in cAMP is the cause of diarrhoen in humans and animals e.g. pigs. The mucosal immunogenicities of mutant heat-labile endotoxins LTS63Y and LTdell10/112 were tested. Groups of mice were immunised with LTS63Y or LTdell10/112. The control groups received phosphate buffered saline (PBS) alone. The serum and caecal antibody titres to LT were determined. The results showed that comparable level of anti-LT antibodies in sera and faecal extracts compared with those immunised with wild-type LT. The LT mutants are useful as a vaccine for preventing and treating diarrhoea and as an active of antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New detoxified mutants of Escherichia coli heat-labile enterotoxin useful as vaccine for preventing and treating diarrhoea, and as adjuvant for antibody production -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    E. coli heat-labile enterotoxin (LT) mutant LTdell10/112 DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the initiator methionine codon. Novel polynucleotides encode a mutant LIT-A polypeptide or a mutant Vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LIT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LIT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. coli or V. Note: This sequence does not appear in the specification. It was constructed from the wild type LT-A cDNA shown in AAA51106 which is given in Figure 1 of the specification.

initiator methionine codon. Novel polynucleotides encode a mutant LT-A polypeptide or a mutant Vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                549
                                                                                                                                                                                                                                                                                                                                                                  This CDNA encodes a mutant A72R Escherichia coli heat-labile toxin (LT) A subunit (LT-A). The nucleotides at position 273-274 were changed from the wild-type GC to AG which causes a change of alanine to arginine in the mature protein at residue 72. The sequence contains plant-preferred
                                                                                                                                                                                                                                                             processing. A single codon insertion (GTG encoding valine) was made to accompate the creation of a NcoI restriction site around the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polynucleotides encoding LT-A or CT-A polypeptides for the transformation of plant cells, useful in immunogenic compositielicit immune responses in animals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   599
                                                                                                                                                                                                                                                                                                                                       codons and eliminates sequence motifs associated with spurious mRNA

The mutant polypeptides are also useful as adjuvants.

Note: This sequence does not appear in the specification. It was constructed from the wild type LT-A cDNA shown in AAA51106 which is given in Figure 1 of the specification.
                                                                                                                                                                                                                enterotoxigenic bacteria; vaccine; immunogenic protomer A; site-directed mutagenesis; reduced ADP-ribosyltransferase activity; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               576
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           526
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     476

                                                                                                                                                                                                                                                                                                                                                                  The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51315 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).

                                                                                             The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51316 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-501326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51317 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51318 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino primer sequence used to introduce the preferred mutation. (Amino primer sequence used to introduce the preferred mutation.

The sequence was published by Yamamoto et al, J.Bifect humans, 259, 5037-5044.

Mutations at selected positions within this sequence have been found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to

    useful as vaccines against intection
enterotoxin producing Escherichia coli

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     enterotoxigenic bacteria;

```

This sequence corresponds to the coding region for the A subunit of the E. coli heat labile toxin, an example of a bacterial ADP-ribosylating toxin. A mutant detoxified form of this protein is used in a parenteral adjuvant composition, which comprises the detoxified protein, at least one selected antigen and optionally a pharmaceutically acceptable (optionally topical) vehicle. The adjuvant composition can be

It can be administered prior/subsequent to the antigen, and is preferably administered within a short space of time to the same site; it can also be administered in isolation from antigens as a boost following systemic or mucosal antigen administration. Most preferably, the adjuvant is co-administered with the antigen in the compositions and a pharmaceutically acceptable carrier. The antigen may be derived from viruses, bacteria, parasites and fungi or may be tumour antigens, self-antigens and allergens. The compositions are therefore useful in the treatment and prevention of e.g. viral diseases, allergic manifestations, diseases caused by pathogens (e.g. bacteria or parasites), AIDS, autoimmune diseases. The adjuvant has the ability to enhance the humoral and cell-mediated immune responses elicited by the antigen (e.g. by making the antigen more strongly immunogenic or necessitating fewer/lower antigen doses). It can be administered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            345

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51321 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).

                                                                                                                                                                                                     The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51322 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     enterotoxigenic bacteria; vaccine; immunogenic detoxifie protomer A; site-directed mutagenesis; reduced toxicity; ADP-ribosyltransferase activity; ss.

   The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42788) was subjected toxic-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51323 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         451
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              401

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51324 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  357
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunogenic detoxified mutant cholera toxin and heat labile toxin - useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
                                                                                                                                                                                                                                                       enterotoxigenic bacteria; vaccine; immunogenic detoxified LT-A;
protomer A; site-directed mutagenesis; reduced toxicity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     507

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to Immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51320 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Immunogenic detoxified mutant cholera toxin and heat labile toxin useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
                                                                                                                                    510

                                                                                                                                                                                                                                                                             The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51325 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          misc_difference 328..330
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       enterotoxigenic bacteria; vaccine; immorrotomer A; site-directed mutagenesis;

                                                                                                                                                                    The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51314-Q51326). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. Sequence AAQ51326 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation. (Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                                                                                                                                                                                                                                           Immunogenic detoxified mutant cholera toxin and heat labile toxin useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli

                                                                                                                           The present sequence is that of the LTf fragment which encodes part of the thermolabile enterotoxin subunit-A sequence and all of the subunit-B sequence of Shigella flexneri. The DNA fragment is useful as a probe for specific detection of toxigenic enterobacteria.

       CC Vibrio cholerae nucleic acid by: (a) performing a polymerase chain cc reaction (PCR), by combining a medium containing toxigenic V. cholerae nucleic acid with an oligonuclectide primer (I) which will bind to a containing toxigenic V. cholerae containing toxigenic V. cholerae cc section of V. cholerae nucleic acid, in an environment suitable for cc carrying out PCR; (b) combining the medium with a second primer which cc will bind downstream to the first primer to a section of the complementary strand of the V. cholerae nucleic acid; and (c) amplifying corresponding sections of V. cholerae nucleic acid present in the medium. CC the method is useful for detecting toxigenic V. cholerae organisms or cc toxigenic V. cholerae nucleic acid, e.g., ctxA gene, in an environmental cc water sample e.g., tap water sample, river water sample, lake water cc sample or a sewage sample. The method is useful in PCR assays for cc detecting a microorganism or nucleic acid of the microorganism in a cc sample. (I) and amplification products are useful for detecting toxigenic CC V. cholerae nucleic acid in a sample. The PCR method involving (I) is creiton from the V cholerae cran cannot seem to genence represents a cc region from the V cholerae cran cran suches to constitute for detecting toxigenic confidence in water samples. The present sequence represents a cc region from the V cholerae cran cran suches to constitute for detecting toxigenic confidence confidence confidence cran cannot cran cannot cran cannot constitute for detecting toxigenic confidence confidence confidence cannot cannot constitute for detecting toxigenic confidence confidence confidence cannot can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          seq_name:
         The present invention describes a method for amplifying (A1) toxigenic Vibrio cholerae nucleic acid by: (A) performing a polymerase chain creaction (PCR), by combining a medium containing toxigenic V. cholerae nucleic acid with an oligonucleotide primer (I) which will bind to a containing toxigenic V. cholerae nucleic acid, in an environment suitable for carrying out PCR; (b) combining the medium with a second primer which will bind downstream to the first primer to a section of the complementary strand of the V. cholerae nucleic acid; and (c) amplifying corresponding sections of V. cholerae nucleic acid present in the medium. The method is useful for detecting toxigenic V. cholerae organisms or toxigenic V. cholerae nucleic acid, e.g., ctxA gene, in an environmental water sample or a sewage sample. The method is useful in PCR assays for detecting a microorganism or nucleic acid of the microorganism in a detecting a microorganism or nucleic acid of the microorganism in a

The PCR method involving (I) rapid, economical, specific and sensitive for detecting toxigenic V. cholerae in water samples. The present sequence represents a region from the V. cholerae ctxA gene, which is used in an example the present invention.
The wild-type sequence coding for the A subunit of the cholera toxin (CT-A) (Mekalanos et al., Nature 306, 551 (1983) - see AAQ46318) was subjected to site-directed mutagenesis. Certain mutations were
                                                                    Immunogenic detoxified mutant cholera toxin and heat labile toxin - useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
